Mexican Feather Grass

Nassella tenuissima

Height: 24 inches

Spread: 24 inches

Sunlight: ☉ ●

Hardiness Zone: 5

Other Names: *Stipa tenuissima*, Needle Grass

Description:

An extremely delicate looking grass that provides gentle movement and sound in even the most delicate of breezes; a textural feast in the hands of a creative garden designer

Ornamental Features

Mexican Feather Grass features airy plumes of gold flowers rising above the foliage in mid summer. Its attractive threadlike leaves are green in color. As an added bonus, the foliage turns a gorgeous harvest gold in the fall. The gold seed heads are carried on showy plumes displayed in abundance from late summer to late winter.

Landscape Attributes

Mexican Feather Grass is a dense herbaceous perennial grass with an upright spreading habit of growth. It brings an extremely fine and delicate texture to the garden composition and should be used to full effect.

This is a relatively low maintenance plant, and is best cleaned up in early spring before it resumes active growth for the season. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Self-Seeding

Mexican Feather Grass is recommended for the following landscape applications;

Planting & Growing

Mexican Feather Grass will grow to be about 20 inches tall at maturity, with a spread of 24 inches. Its foliage tends to remain dense right to the ground, not requiring facer plants in front. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 20 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in full sun to partial shade. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It may require supplemental watering during periods of drought or extended heat. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in both summer and winter to conserve soil moisture and protect it in exposed locations or colder microclimates. This species is not originally from North America. It can be propagated by division.
