

Allen Chickering Sage

Salvia 'Allen Chickering'

Height: 5 feet

Spread: 6 feet

Sunlight: ○

Hardiness Zone: 8

Other Names: *Salvia clevelandii* x *leucophylla*

Description:

A delightfully fragrant hybrid producing whorls of lavender blooms in spring and summer; great for dry, sunny areas; a beautiful addition to borders or beds with its light gray-green foliage and dense, bushy form; little water required once established

Ornamental Features

Allen Chickering Sage has masses of beautiful spikes of lightly-scented lavender flowers rising above the foliage from late spring to late summer, which are most effective when planted in groupings. The flowers are excellent for cutting. Its attractive fragrant narrow leaves remain grayish green in color throughout the year.

Landscape Attributes

Allen Chickering Sage is a multi-stemmed evergreen perennial with an upright spreading habit of growth. Its relatively fine texture sets it apart from other garden plants with less refined foliage.

This is a relatively low maintenance plant, and should only be pruned after flowering to avoid removing any of the current season's flowers. It is a good choice for attracting bees, butterflies and hummingbirds to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

Allen Chickering Sage is recommended for the following landscape applications;

- Mass Planting
- Hedges/Screening
- General Garden Use

Better Plants. Better Advice. Better Results.

Planting & Growing

Allen Chickering Sage will grow to be about 4 feet tall at maturity, with a spread of 6 feet. Although it is technically a woody plant, this plant can be expected to behave as a perennial in our climate if planted outdoors over the winter, usually regrowing from its base (crown) the following year. As such, gardeners should take into consideration that it will perform differently than it would in its native habitat.

This plant should only be grown in full sunlight. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is considered to be drought-tolerant, and thus makes an ideal choice for a low-water garden or xeriscape application. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This particular variety is an interspecific hybrid. It can be propagated by cuttings; however, as a cultivated variety, be aware that it may be subject to certain restrictions or prohibitions on propagation.
